

## Access control and vehicle guidance for free parking locations, for Palma de Mallorca Airport

**plettac electronics** has participated in the project of an access control system, free parking places control, and vehicle routing, for the public parking facilities of Palma de Mallorca airport. The project has covered both public and subscribers parking lots, although in the subscriber parking lots case, the system deployed is limited to the technologies needed for access control.

The joint venture in charge of the work, which **plettac electronics** is part of, has undertaken the renovation and upgrading of systems and devices associated with the access control of four floors, automatic payment machines and control center. In addition, on-the-boundary cameras have been installed at the vehicle entrance and exit platforms.

The new free parking places location system, together with the vehicles routing and tracking system, greatly benefit airport users, in that a significant reduction of time is achieved thanks to the automatic aid systems that operate in the six floors of the parking facilities.

The new access control systems have also implied a change in the subscriber identification procedure, now based on card reading recognition protocols.
